

Aim of the long-term CENAA program on cyber security (Global Netizenship in Cyberworld - GNC) is in-depth analysis of multi-spectral and cross-cutting issues of national and international security. In last years, cyber attacks have become powerful and fully-fledged tool in conventional war and industrial espionage. Through establishing network of national and international partnerships, CENAA strives to ensure that cyber security will get into focal point of political, corporate and expert elites. Goal of this Newsletter and GNC project is also de-tabuise issue of cyber security to all.

## **YAHOO PROTECTS USERS WITH LOTS MORE ENCRYPTION:**

We were thrilled to hear today that Yahoo is carrying through a concerted effort to protect users across its sites and services by rolling out routine encryption in several parts of its infrastructure. The company's statement announced that, among other things, it now encrypts traffic between its data centers, makes secure HTTPS connections the default for some web sites, and has turned on encryption for mail delivery between Yahoo Mail and other email services that support it (like Gmail). Electronic Frontier Foundation, April 2, 2014

## **U.S. STATES INVESTIGATING BREACH AT EXPERIAN:**

An exclusive KrebsOnSecurity investigation detailing how a unit of credit bureau Experian ended up selling consumer records to an identity theft service in the cybercrime underground has prompted a multi-state in-

vestigation by several attorneys general, according to wire reports. KrebsOnSecurity, April 3, 2014

## **END OF WINDOWS XP SUPPORT MEANS ADDED OPPORTUNITY FOR HACKERS:**

Microsoft is counting down to the end of an era. On April 8, the company officially washes its hands of Windows XP, an operating system introduced in 2001 that comprises 45 million lines of code. You can watch the clock tick down in slightly eerie fashion, green boxes on a purple background, on Microsoft's website, which also gives some pithy advice on what this means: "It means you should take action." BusinessWeek, April 4, 2014

## **MOST SOPHISTICATED ANDROID MALWARE YET HAS ALREADY INFECTED MILLIONS:**

Android is still the most targeted mobile platform out

there in terms of mobile malware, considering the reports that keep detailing ways that hackers can take advantage of it for malicious purposes. But in most cases it's Android users from certain regions of the world who are affected, because Google's standard Android services aren't available. A new report from The Hacker News details some new Android malware that may be the biggest threat to the operating system to date, and it may have already infected millions of devices. BGR, April 4, 2014

**ADOBE, MICROSOFT PUSH CRITICAL FIXES:**

Adobe and Microsoft each issued updates to fix critical security vulnerabilities in their software today. Adobe patched its Flash Player software and Adobe AIR. Microsoft issued four updates to address at least 11 unique security flaws, including its final batch of fixes for Office 2003 and for systems powered by Windows XP. KrebsOnSecurity, April 8, 2014

**INSIDE THE NIST FRAMEWORK TO IMPROVE CYBERSECURITY:**

President Obama's Executive Order 13636, "Improving Critical Infrastructure Cybersecurity," issued a year ago, established U.S. policy for maintaining a cyber environment that encourages "efficiency, innovation, and economic prosperity while promoting safety, security, business confidentiality, privacy, and civil liberties." The Order calls for a voluntary, risk-based cybersecurity framework. The National Institute of Standards and Technology (NIST) recently released the framework, a set of industry standards and best practices to help organizations manage cybersecurity risks. The NIST framework is not intended to replace existing processes, but to complement business and cybersecurity operations. Enterprises can use the framework as part of their processes for identifying, assessing and managing cybersecurity risk. CIO Insight, April 10, 2014

## CLANDESTINE FOX NIPS AT EXPLORER'S HEELS:

Microsoft has vastly improved IE's security, but its penchant for supporting legacy users by carrying old code into new versions has backfired in this case. "Internet Explorer is an older browser, and when you find a vulnerability like this that effects several versions, a lot of time you'll find it in a part of the browser that hasn't changed in 10 years," said Rapid7's Ross Barrett.
